                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               molecule (1) that, induces apoptosis in cells with a abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diseases associated with the Fas/Fas ligand system, especially systemic

                versus host disease, Sjorgen's syndrome, pernicious or hypopiastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody HEFTA designed heavy chain which is used in the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fas; antibody; human; anti-inflammatory; anti-anemic; antidiabetic; anti-allergic; anti-arthritic; antiviral; immunownodulatory; cardiant; dermatological; immunosuppressive; thyrominetic; antirheumatic; anti-Fas; nephrotropic; antiinfertility; neuroprotective; antiarteriosclerotic; hepatotropic; humanized; apoptosis; systemic lupus erythematosus; Hashimoto disease; rheumatoid arthritis; graft versus host disease; Sjorgen's syndrome; anemia; Addison's disease; scleroderma; sterility;

This invention describes a novel humanized anti-Fas antibody-like
molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas
ligand system, by binding to Fas on the cell surface, and prevents
apoptosis in cells with a normal system, by inhibiting binding between
capptosis in cells with a normal system, by inhibiting binding between
capptosis in cells with a normal system, by inhibiting binding between
canti-anemic, antidiabetic, anti-alergic, anti-arthritic, antiviral,
immunomodulatory, dermatological, immunosuppressive, thyromimetic,
antirheumatic, nephrotropic, antilnfertility, neuroprotective,
antirheumatic, nephrotropic, antilnfertility, neuroprotective,
antirheumatic, nephrotropic, antilnfertility, neuroprotective,
cantilatoric cardiant and hepatropic activity. (I) induce
apoptosis by binding to cell surface Fas or inhibit it by competitive
capptosis by binding to cell surface Fas or inhibit it by competitive
capptosis by binding to salfamers system, especially systemic
lupus erythematosus, Hashimoto disease, remaina, apoptosis
clupus erythematosus, Hashimoto disease, remaina, apoptosis,
canemia, Addison's disease, scleroderma, sterility, myasthenia gravis,
and the sclerosis, Basedow's disease, thrombopenia purpura, insulin
callatory, alomerulonephritis, hepatitis (fulminant, chronic, viral
(B, C or D) or alcoholic), and transplant rejection. (I) selectively
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
(C) inhibit apoptosis in normal cells but selectively induce it in abnormal
cells. They bind to both human and murine Fas, so can be evaluated in
mutine disease models. (I) act on the active site of Fas, i.e. they minic
the native ligand, do not induce liver disease, and have reduced risk of
inducing a human anti-murine antibody response. This sequence represents
a humanised anti-Pas antibody heavy chain construct designated Heu 3
which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       121 YSNNWYFDVWGEGTLVTVSSASTKGPSVFPLAPSSKSTSGGTAALGCLVKDYFPEPVTVS 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GQGLEWMGEIDPSDSYTNYNQKFKGRVTITRDTSTSTAYMELSSLRSEDTAVYYCARNRD 120
Goodpasture syndrome, Crohn's disease, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, allergy, insulin dependent diabetes mellitus; arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis, transplant rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Humanised anti-Fas designed heavy chain Heu 1 protein.

```
dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardlomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (b. Cor D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu 2 which is described in the method of the invention.
apoptosis in cells with a normal system, by inhibiting binding between fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyronimetic, antianteriors, nephrotropic, antiinfertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, soleroderma, goodpasture syndrome, crohn's disease, altolumune hemolytic anemia, sterility, myasthenia gravis, and the solerosis, Basedow's disease, thrombopenia purpure, issulin

Sednence

Length 470;

This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas (I igand system, by binding to Fas on the cells with an abnormal Fas/Fas apoptosis in cells with a normal system, by indining binding between apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, antidiabetic, and hibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent apoptosis by binding to cell surface Fas or inhibit it by competitive compactives apoptosis. Hashimoto disasse, permitticious or hypoplastic versus host disease, sloreoderma, permitcious or hypoplastic community Addison's disease, scleroderma, goodpasture syndrome, Cohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, allergy, arteriosclerosis, myocarditis, cardiomyopathy glomerulonephitis, hepatitis (fulminant, chronic, viral (E, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic the native ligand, do not induce liver disease, and have reduced risk of the native ligand, do not induce liver disease, and have reduced risk of which is described in the method of the invention. Fas; antibody; human; anti-inflammatory; anti-anemic; antidiabetic; anti-allergic; anti-arthritic; antiviral; immunomodulatory; cardiant; dermatological; immunosuppressive; thyromimetic; antirheumatic; anti-Fas; nephrotropic; antiinfertility; neuroprotective; antiarteriosclerotic; hepatotropic; humanized; apoptosis; systemic lupus erythematosus; Hashimoto disease; rheumatoid arthritis; graft versus host disease; Sjorgen's syndrome; anemia; Addison's disease; scleroderma; sterility; Goodpasture syndrome; Crohn's disease; sterility; myasthenia gravis; multiple solerosis; Basedow's disease; thrombopenia purpura; allergy; insulin dependent diabetes mellitus; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; hepatitis; transplant rejection. New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems Takahashi Tamaki I, Nakahara K, Claim 2; Page 169-170; 263pp; English. 98JP-0276882. 99EP-0307711. 98JP-0276881. This is the amino acid sequence of the VD type humanised heavy
chain of murine anti-human Fas monoclonal antibody HFE7A.

Edision of murine anti-human Fas monoclonal antibody HFE7A.

E coli
pgHSL7A62 carrying a fusion

E ragment of the humanised VD type HFE7A heavy chain and DNA
encoding human IgG1 constant region (see AAV70079), and is deposited
as FERM BP-6074 (Claimed). The invention provides methods for

E producing humanised antibodies by culturing host cells. Humanised
versions of HFE7A (see AAW83031-37), like native HFE7A, are capable
of inducing apoptosis in abnormal cells expressing Fas, and of
antibodies are used to evaluate, in animal models, treatments of
antibodies are used to evaluate, in animal models, treatments of
antibodies are used to evaluate, in animal models, treatments of
alseases that involve Fas/Fas ligand interactions, and also to
treat such diseases, including autoimmune disease (e.g. systemic
lupus erythematosus, Hashimoto's disease, graft versus host disease,
Sjogren syndrome, Derniclous anaemia, Addison's disease, selenoderma,
Goodpasture syndrome, Crohn's disease, thromatoid arthritis,
autoimmune haemolytic anaemia, sterility, myasthenia gravis,
multiple sclerosis, Basedow's disease, thromatopenia purpura and
insulin-dependent diabeters), allengies, arteriosclerosis,
myocarditis, cardiomyopathy, glomecular nephritis, hypoplastic
myocarditis, cardiomyopathy, glomecular rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GQGLEWMGEIDPSDSYTNYNQKFKGRVTITRDTSTSTAYMELSSLRSEDTAVYCARNRD 120

The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autofimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS represent the heavy chains (or fragments thereof) of various humanised HFETA-derived anti-Fas antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains

Intias Infortion describes a flower numerized anti-Fas antibody-Inke molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents cappetosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunodulatory, dermacological, immunosuppressive, thyromimetic, antidiabetic, antidiffertility, neuroprotective, antiviral, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic versus host disease, Sjorgen's Syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, alleryy arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, Cor D) or alcoholic), and transplant rejection. (I) selectively cinhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in the native ligand, do not induce litver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents the much as human anti-murine antibody response. This sequence represents and human anti-marine antibody response. This sequence represents the method described in the inventy designed heavy chain which is the security of the induce lity the disease.
                                                                                                                                                        J.e.c
                                                                                                                                                              preventing
                                                                                                                                                           New humanized anti-Fas antibody, useful for treating or preventing inflammatory or autoimmune disease, induces apoptosis selectively
                                                                                                                                                                                                                                                                                                                      This invention describes a novel humanized anti-Fas antibody-like

The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM52154-AAM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                        Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1;
cytotoxic; endonuclease; DNase I; human; cytostatic; cancer; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GQGLEWMGEIDPSDSYTNYNQKFKGRVTITRDTSTSTAYMELSSLRSEDTAVYYCARNRD 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM$2154-AAM$2168 and encoded by ABA02582-ABA02128. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1;
cytotoxic; endonuclease; DNase I; human; cytostatic; cancer; apoptosis.

                                                                                             1;
having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AMM52154-AAM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1;
cytotoxic; endonuclease; DNase I; human; cytostatic; cancer; apoptosis.

                                                                                                                                                                                                   The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytocoxic portion having endonucleolytic activity, exemplified by AAM52154-ABM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1; cytotoxic; endonuclease; DNase I; human; cytostatic; cancer; apoptosis.

The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.

Patent No. 6133426

GENERAL INFORMATION:

APPLICANT: Gonzalez, Tania R.

APPLICANT: Deong, Steven R.

APPLICANT: Deong, Steven R.

APPLICANT: Presta, Leonard G.

TITLE OF INVENTION: Antibody Fragment-Polymer Conjugates and TITLE OF INVENTION: Humanized Anti-IL-8 Monoclonal Antibodies NUMBER OF SEQUENCES: 72

CORRESPONDENCE ADDRESS:

ADDRESSE: Genentech, Inc.

STREET: 1 DNA Way

CITY: South San Francisco

STATE: California

COUNTRY: USA

CONPERT USA

COMPTER READABLE FORM:

MEDIUM TYPE: 3.5 inch, 1.44 Mb floppy disk
                                                                                                                                                                                                                                         Length 452;
                                                                                                                                                                                                                                                                     Indels

Patent No. 5994511
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Improved Anti-IgE Antibodies and Method of
TITLE OF INVENTION: Improving Polypeptides
NUMBER OF SEQUENCES:
ADDRESSEE: Genentech, Inc.
STREET: 1 DNA Way
CITY: South San Francisco
STATE: California
COUNTRY: USA
                                                                                                                                                          5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        438

C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light hain disulfide bonds: In some cases, such as IgA and IgM, the subunits associate into C; Complex: An immunoglobulin C region; immunoglobulin homology
C; Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin
F; 20-87/Domain: immunoglobulin homology < IM2>
F; 20-87/Domain: immunoglobulin homology < IM3>
F; 213-202/Domain: immunoglobulin homology < IM3>
F; 14/Pisulfide bonds: interchain (to light chain) #status experimental
F; 102.103,106,109/Disulfide bonds: interchain (to heavy chain) #status experimental
F; 102.103,106,109/Disulfide bonds: interchain (to heavy chain) #status experimental
F; 102.103,106,109/Disulfide bonds: interchain (to heavy chain) #status experimental
F; 102.103,106,109/Disulfide bonds: interchain (to heavy chain) #status predicted

cDNA sequences
               G; Species: Sus scrofts domestic and projection of Species: Sus scrofts domestic and (c) because in 1997 #sequence_revision 21-Feb-1997 #text_change 21-Jan-2000 C; Accession: 147160
B; Kacskovics, I:, Sun, J.; Butler, J.E.
J. Immunol. 153, 3565-3573, 1994
A; Title: Five putative subclasses of swine IgG identified from the CDNA sequence A; Reference number: 147158; MUID:95015845
A; Accession: I47160
A; Accession: I47160
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Residues: 1-328 «KAC>
A; Cross-references: EMBL:U03780; NID:9433125; PIDN:AAA52218.1; PID:9433126
C; Genetics:
A; Gene: IgG2b
C; Superfamily: immunoglobulin C region; immunoglobulin homology
F; 133-202/Domain: immunoglobulin homology < IMM>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7

ALERNATUR PRODUCTS: CELL LINES PRODUCING IGG CONTAIN TWO MRNA SPECIES FOR IG GAMMA CHAINS. THE MAJOR SPECIES ENCODES SECRETED GAMMA CHAINS. A LESS ABUNDANT SPECIES APPEARS TO ENCODE MEMBRANE-BOUND CHAINS IN THAT IT CONTAINS AN ALTERNATIVE 3' END, ENCODED IN SEPARATE EXONS, THAT IS HOMOLOGOUS WITH THE MEMBRANE-BOUND SEGMENT OF MU CHAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
